(54) Title: **BIOBENEFICIAL COATING COMPOSITIONS AND METHODS OF MAKING AND USING THEREOF**

(57) Abstract: A biobeneficial coating composition for coating an implantable device, such as a drug eluting stent, and a method of coating the device with the composition, and an implantable device coated with the composition are provided.

## BIOBENEFICIAL COATING COMPOSITIONS AND METHODS OF MAKING AND USING THEREOF

### 5 BACKGROUND OF THE INVENTION

#### Field of the Invention

This invention generally relates to a polymeric coating composition for coating an implantable device, such as a stent.

#### 10 Description of the Background

Polymeric coatings have been used for coating stents. One of the commercially available polymer coated products is stents manufactured by Boston Scientific. For example, U.S. Patent Nos. 5,869,127; 6,099,563; 6,179,817; and 6,197,051, assigned to Boston Scientific Corporation, describe various compositions for coating medical devices. These compositions provide to stents  
15 described therein an enhanced biocompatibility and may optionally include a bioactive agent. U.S. Patent No. 6,231,590 to Scimed Life Systems, Inc., describes a coating composition which includes a bioactive agent, a collagenous material, or a collagenous coating optionally containing or coated with other bioactive agents.

The nature of the coating polymers plays an important role in defining the surface  
20 properties of a coating. For example, very a low  $T_g$ , amorphous coating material induces unacceptable rheological behavior upon mechanical perturbation such as crimping, balloon expansion, etc. On the other hand, a high  $T_g$ , or highly crystalline coating material introduces brittle fracture in the high strain areas of the stent pattern.

A current paradigm in biomaterials is the control of protein adsorption on the implant  
25 surface. Uncontrolled protein adsorption, leading to mixed layer of partially denatured proteins, is a hallmark of current biomaterials when implanted. Such a surface presents different cell binding sites from adsorbed plasma proteins such as fibrogen and immunoglobulin G. Platelets and inflammatory cells such as monocyte/macrophages and neutrophils adhere to these surfaces. Unfavorable events can be controlled by the use of non-fouling surfaces. These are materials,  
30 which absorb little or no protein, primarily due to their hydrophilic surface properties.

Another limitation of current drug eluting stents stems from the fact that the stent is a foreign body. Use of drug eluting stents has proved successful by use of controlled release of anti-proliferative drugs to control restenosis. However, drug eluting stents still have a small, but measurable, incidence of sub-acute thrombosis. Moreover, drug eluting stents have not driven

restenosis to zero levels, especially in more challenging patient subsets such as diabetics or patients with small vessels, and/or long, diffuse lesions. A biomaterials-based strategy for further improving the outcome of drug eluting stents is by the use of biobeneficial materials or surfaces in stent coatings. A biobeneficial material is one which enhances the biocompatibility of a device by  
5 being non-fouling, hemocompatible, actively non-thrombogenic, or anti-inflammatory, all without depending on the release of a pharmaceutically active agent.

U.S. application No. 2002/0107330 to Pinchuk, et al., describes a composition containing a blend of polystyrene-polyisobutylene-polystyrene copolymer and paclitaxel in various ratios. The composition, when coated onto an implantable device, may be covered with a barrier layer of,  
10 or blended with, a polymer or material such as polyethylene oxide or hyaluronic acid (see also Pinchuk, et al., "Polyisobutylene-based Thermoplastic Elastomers for Ultra Long-Term Implant Applications," Society for Biomaterials, 6<sup>th</sup> World Biomaterials Congress Transactions, 2000, #1452; Drachman DE, et al., J. Amer. Coll Cardiology, 36(7):2325-2332 (2000); Pinchuk, J. Biomater. Sci. Polymer edn., 6(3):225-267 (1994)). However, it is well known in the art that  
15 many biobeneficial materials such as polyethylene oxide or hyaluronic acid are water-soluble and can be leached out of the composition such that the coating may lose biobeneficiality.

The present invention addresses such problems by providing a coating composition for coating implantable devices.

## 20 SUMMARY OF THE INVENTION

It is provided a biobeneficial composition for coating an implantable device or delivery of a bioactive agent. The biobeneficial composition comprises a first block copolymer and a biobeneficial polymer. Alternatively, the biobeneficial polymer may comprise a first block  
25 copolymer and a second block copolymer, the second block copolymer comprising a biobeneficial component and another component, which is either water soluble or miscible with the first block copolymer. The first block copolymer has a block with a  $T_g$  below about body temperature and another block that has a  $T_g$  above about body temperature or has considerable crystallinity with a  $T_m$  above about body temperature. As used herein, the term "body temperature" refers to the normal body temperature of a human, which is about 37 °C, e.g., about 36 °C to 37.5 °C. The  
30 block with a  $T_g$  below about body temperature has an amorphous structure and is elastomeric. The composition described herein is elastomeric but very oxidation resistant. The high  $T_g$  block renders the first block copolymer not very permeable, or accessible, to reactive oxygenated species. The elastomeric, low  $T_g$  block can be oxidation resistant. The composition described herein may further include a bioactive agent.

The composition described herein can be used for coating an implantable device such as a stent or for controlled delivery of a bioactive agent.

#### BRIEF DESCRIPTION OF THE FIGURES

Figure 1 is a scheme of forming a conjugate of polystyrene-polyisobutylene-polystyrene block copolymer with poly(ethylene glycol) (PEG).

Figure 2 is a scheme of forming a conjugate of polystyrene-polyisobutylene-polystyrene block copolymer with 4-amino-2,2,6,6-tetramethylpiperidine-1-oxide (4-amino-TEMPO).

#### DETAILED DESCRIPTION

##### Biobeneficial Compositions

A biobeneficial composition for coating an implantable device or delivery of a bioactive agent is provided. The biobeneficial composition comprises a first block copolymer and a biobeneficial polymer. Alternatively, the biobeneficial composition may comprise a first block copolymer and a second block copolymer, the second block copolymer comprising a biobeneficial component and another component that is either water insoluble or miscible with the first block copolymer. The first block copolymer has a block with a  $T_g$  below about body temperature and another block with a  $T_g$  above about body temperature or that has considerable crystallinity with a  $T_m$  above about body temperature. The block with a  $T_g$  below about body temperature has an amorphous structure and is elastomeric. Functionally, the elastomeric, low  $T_g$  block provides for flexibility, and the block with  $T_g$  or  $T_m$  above about body temperature acts as a virtual crosslink. The composition described herein may further include a bioactive agent.

$T_g$  as used herein generally refers to the temperature at which the amorphous domains of a polymer change from a brittle vitreous state to a plastic state at atmospheric pressure. In other words,  $T_g$  corresponds to the temperature where the onset of segmental motion in the chains of the polymer occurs, and it is discernible in a heat-capacity-versus-temperature graph for a polymer. When an amorphous or semicrystalline polymer is heated, its coefficient of expansion and heat capacity both increase as the temperature rises, indicating increased molecular motion. As the temperature rises, the sample's actual molecular volume remains constant. Therefore, a higher coefficient of expansion points to a free volume increase of the system and increased freedom of movement for the molecules. The increasing heat capacity corresponds to increasing heat dissipation through movement.

$T_g$  of a given polymer can be dependent on the heating rate and can be influenced by the thermal history of the polymer. Furthermore, polymer chemical structure heavily influences  $T_g$  by

affecting polymer mobility. Generally, flexible main-chain components lower  $T_g$  and bulky side groups raise  $T_g$ . Similarly, increasing flexible-side-group length lowers  $T_g$  and increasing main-chain polarity increases  $T_g$ . Additionally, the presence of crosslinks can increase the observed  $T_g$  for a given polymer, and the presence of a drug or therapeutic agent can alter the  $T_g$  of a polymer due to plasticization effects. The magnitude of these plasticization effects depends on the miscibility and compatibility of the drug and polymer and the loading of drug in the polymer.

As used herein, the term "biobeneficial" refers to an attribute of a material that increases the biocompatibility and/or bio-responses of a coating on an implantable device.

The term "water insoluble" as used herein refers to an attribute of a material having a quality of being insoluble as understood by one of ordinary skill in the art. One indication of a material's being insoluble is the material having a solubility in water less than or equal to 1% (w/w) or 10 mg/gm at 37 °C and 1 atm.

The composition described herein is elastomeric, but very oxidation resistant. The high  $T_g$  block renders the first block copolymer not very permeable, or accessible, to reactive oxygenated species. The elastomeric, low  $T_g$  block can be oxidation resistant. For example, the elastomeric, low  $T_g$  block can be a polyisobutyl block, which is oxidation resistant because every other carbon is a tertiary carbon. Free radicals and oxidants can attach and oxidize the  $CH_2$  moieties of the polyisobutyl block forming hydroxyl and carbonyl groups. However, due to the alternating secondary and tertiary carbons, no secondary carbons are adjacent, making it impossible to form carbon-carbon double bonds in the polymer backbone. Consequently, the backbone of the polyisobutyl block will remain intact.

The composition described herein can be used for coating an implantable device such as a stent or for controlled delivery of a bioactive agent. The composition can also be used to make an implantable medical device.

In accordance with one aspect of the invention, the composition disclosed herein comprises a conjugate of a first block copolymer comprising at least one elastomeric block having a  $T_g$  below about body temperature and another block having a  $T_g$  or  $T_m$  above about body temperature with a biobeneficial polymer. The block having a  $T_g$  above about body temperature has a structure of Formula I and the elastomeric block having a  $T_g$  below about body temperature has a structure of Formula II:

Formula I

Formula II

wherein  $R_1$ ,  $R_2$ ,  $R_3$  and  $R_4$  are independently hydrogen, phenyl, methyl, ethyl, carboxylate, acrylate, or methacrylate provided that  $R_1$ ,  $R_2$ ,  $R_3$  and  $R_4$  cannot be all hydrogen;  $R_5$  and  $R_7$  or  $R_6$  and  $R_8$  are independently methyl, ethyl, propyl, butyl, benzyl, or phenyl; and  $R_6$  and  $R_8$  or  $R_5$  and  $R_7$  are independently hydrogen, methyl, ethyl, propyl, benzyl, or phenyl. The high  $T_g$  block can be polystyrene, poly(methyl methacrylate), poly(ethyl methacrylate), poly(propyl methacrylate), poly(isopropyl methacrylate), poly(4-methylstyrene), poly(alpha-methyl styrene), poly(benzyl methacrylate), poly(tert-butyl methacrylate), poly(chloro-styrene), or poly(bromo-styrene).

Useful elastomeric, low  $T_g$  block includes, poly(isobutylene), poly(n-butyl methacrylate), poly(n-hexyl methacrylate), poly(n-octyl methacrylate), poly(n-lauryl methacrylate), poly(2-ethylhexyl methacrylate), and poly(octadecyl methacrylate). The first block copolymer can be an A-B diblock copolymer or A-B-A or B-A-B triblock copolymer.

In one embodiment, the first block copolymer has the following structure of formula III:

Formula III

wherein  $m$  and  $n$  are positive integers.

In a further embodiment, the conjugate can have a structure of the following:

wherein m and n are positive integers; or

5

wherein m and n are positive integers.

Representative biobeneficial polymers include, but are not limited to, poly(ethylene glycol) (PEG), poly(propylene glycol), PLURONIC<sup>TM</sup> surfactants which are block copolymers based on ethylene oxide and propylene oxide, poly(tetramethylene glycol), hydroxy functional poly(vinyl pyrrolidone), polyalkylene oxide, dextran, dextrin, sodium hyaluronate, hyaluronic acid, sulphonated poly(styrene), heparin, Elastin, Chitosan, poly(2-hydroxyethyl methacrylate), poly(3-hydroxypropyl methacrylamide), 4-amino-2,2',6,6'-tetrapiperidine oxide, stable nitroxides, super oxide dimutase mimics, free radical scavengers, and combination thereof. The biobeneficial can be conjugated to the high T<sub>g</sub> block of the block copolymer via a linkage, which can be a direct

10

15

covalent bond, hydrogen bond, ionic bond or chelate. Preferably, the linkage is covalent such as through an amino linkage, an ester linkage, an ether linkage, a peptide linkage, an amide linkage, a urethane linkage, a carbonate linkage, via a carbon-carbon bond, a hydrazide linkage, a sulfonate linkage, a sulfone linkage, or a thiol ether linkage. The biobeneficial polymer can be attached to the high T<sub>g</sub> block of the block copolymer via any method known in the art (see, for example, Michael Smith, Organic Synthesis, 2<sup>nd</sup> Edition, McGraw-Hill, 2001).

As an example, PEG is attached to polystyrene-polyisobutylene-polystyrene (SIS) triblock copolymer via reductive amination as shown in Figure 1. First, the SIS triblock copolymer is subjected to acylation in the presence of a Lewis acid catalyst such as AlCl<sub>3</sub>. The acylated SIS triblock copolymer is then subjected to reductive amination with commercially available mPEG-NH<sub>2</sub> (available from vendors such as Nektar) in the presence of a reducing agent such as sodium cyanoborohydride, forming a SIS-PEG conjugate as shown in Figure 1

As a further example, a small molecule such as 4-amino-2,2',6,6'-tetrapiperidine oxide (4-amino-TEMPO) can be attached to a SIS triblock copolymer as shown in Figure 2. The SIS triblock copolymer is first subjected to acylation in the presence of a Lewis acid such as AlCl<sub>3</sub>. The acylated SIS triblock copolymer is then subjected to reductive amination in the presence of sodium cyanoborohydride to form a 4-amino-TEMPO derivatized SIS triblock copolymer (Figure 2).

In accordance with another aspect of the invention, the composition disclosed herein comprises a first block copolymer comprising a block with a T<sub>g</sub> above about body temperature and an elastomeric block with a T<sub>g</sub> below about body temperature and a second block copolymer comprising a biobeneficial component and another component which is water insoluble or miscible with the first block copolymer, which is described above. The component miscible with the first block copolymer is hydrophobic. Representative examples can include polystyrene-polyisobutylene-polystyrene block copolymer (SIS), polystyrene, polyisobutylene, polycaprolactone (PCL), poly(L-lactide), poly(D,L-lactide), poly(lactides), polylactic acid (PLA), poly(lactide-co-glycolide), poly(glycolide), polyalkylene, polyfluoroalkylene, polyhydroxyalkanoate, poly(3-hydroxybutyrate), poly(4-hydroxybutyrate), poly(3-hydroxyvalerate), poly(3-hydroxybutyrate-co-3-hydroxyvalerate), poly(3-hydroxyhexanoate), poly(4-hydroxyhexanoate), mid-chain polyhydroxyalkanoate, poly(trimethylene carbonate), poly(ortho ester), polyphosphazenes, poly(phosphoester), poly(tyrosine derived arylates), poly(tyrosine derived carbonates). The water insoluble component of the second copolymer includes, for example, polydimethyloxane (PDMS), polyvinylidene fluoride (PVDF), polyhexafluoropropylene (HFP), polydimethylsiloxane, poly(vinylidene fluoride-co-

hexafluoropropylene) (PVDF-HFP), poly(vinylidene fluoride-co-chlorotrifluoroethylene) (PVDF-CTFE), poly(butyl methacrylate), poly(methyl methacrylate), poly(methacrylates), poly(vinyl acetate), poly(ethylene-co-vinyl acetate), poly(ethylene-co-vinyl alcohol), poly(ester urethanes), poly(ether-urethanes), poly(carbonate-urethanes), poly(silicone-urethanes), poly(urea-  
5 urethanes) and a combination thereof.

In one embodiment, the second block copolymer comprising a biobeneficial component is SIS-PEG, polystyrene-PEG, polyisobutylene-PEG, PCL-PEG, PLA-PEG, PMMA-PEG, PDMS-PEG, PVDF-PEG, SIS-hyaluronic acid (HA), polystyrene-HA, polyisobutylene-HA, PCL-HA, PLA-HA, PMMA-HA, PVDF-HA, SIS-heparin, polystyrene-heparin, polyisobutylene-heparin,  
10 PCL-heparin, PLA-heparin, PMMA-heparin, or PVDF-heparin.

As used herein, a conjugate is formed by combining one material, e.g., a polymer, with one or more other materials, e.g., a polymer of different nature, by ionic interaction, hydrogen bonding, or covalent bonding. The conjugate can be, for example, a block copolymer, an adduct, ion pair, polyelectrolyte complex, or chelate.

15 Active Agents

In accordance with a further embodiment of the invention, the composition described herein may optionally include one or more active agents. The active agent can be for inhibiting the activity of vascular smooth muscle cells. More specifically, the active agent can be aimed at inhibiting abnormal or inappropriate migration and/or proliferation of smooth muscle cells for the  
20 inhibition of restenosis.

The active agent can also include any substance capable of exerting a therapeutic, prophylactic or diagnostic effect. For example, the active agent can be for enhancing wound healing in a vascular site or improving the structural and elastic properties of the vascular site. Examples of active agents include antiproliferative substances such as actinomycin D, or  
25 derivatives and analogs thereof (manufactured by Sigma-Aldrich 1001 West Saint Paul Avenue, Milwaukee, WI 53233; or COSMEGEN available from Merck). Synonyms of actinomycin D include dactinomycin, actinomycin IV, actinomycin I<sub>1</sub>, actinomycin X<sub>1</sub>, and actinomycin C<sub>1</sub>. The active agent can also fall under the genus of antineoplastic, anti-inflammatory, antiplatelet, anticoagulant, antifibrin, antithrombin, antimitotic, antibiotic, antiallergic and antioxidant  
30 substances. Examples of such antineoplastics and/or antimitotics include paclitaxel (e.g. TAXOL<sup>®</sup> by Bristol-Myers Squibb Co., Stamford, Conn.), docetaxel (e.g. Taxotere<sup>®</sup>, from Aventis S.A., Frankfurt, Germany) methotrexate, azathioprine, vincristine, vinblastine, fluorouracil, doxorubicin hydrochloride (e.g. Adriamycin<sup>®</sup> from Pharmacia & Upjohn, Peapack N.J.), and mitomycin (e.g. Mutamycin<sup>®</sup> from Bristol-Myers Squibb Co., Stamford, Conn.).

Examples of such antiplatelets, anticoagulants, antifibrin, and antithrombins include sodium heparin, low molecular weight heparins, heparinoids, hirudin, argatroban, forskolin, vapiprost, prostacyclin and prostacyclin analogues, dextran, D-phe-pro-arg-chloromethylketone (synthetic antithrombin), dipyridamole, glycoprotein IIb/IIIa platelet membrane receptor antagonist antibody, 5 recombinant hirudin, and thrombin inhibitors such as Angiomax<sup>®</sup> (Biogen, Inc., Cambridge, Mass.). Examples of such cytostatic or antiproliferative agents include angiopeptin, angiotensin converting enzyme inhibitors such as captopril (e.g. Capoten<sup>®</sup> and Capozide<sup>®</sup> from Bristol-Myers Squibb Co., Stamford, Conn.), cilazapril or lisinopril (e.g. Prinivil<sup>®</sup> and Prinzide<sup>®</sup> from Merck & Co., Inc., Whitehouse Station, NJ); calcium channel blockers (such as nifedipine), colchicine, 10 fibroblast growth factor (FGF) antagonists, fish oil (omega 3-fatty acid), histamine antagonists, lovastatin (an inhibitor of HMG-CoA reductase, a cholesterol lowering drug, brand name Mevacor<sup>®</sup> from Merck & Co., Inc., Whitehouse Station, NJ), monoclonal antibodies (such as those specific for Platelet-Derived Growth Factor (PDGF) receptors), nitroprusside, phosphodiesterase inhibitors, prostaglandin inhibitors, suramin, serotonin blockers, steroids, 15 thioprotease inhibitors, triazolopyrimidine (a PDGF antagonist), and nitric oxide. An example of an antiallergic agent is permolast potassium. Other therapeutic substances or agents which may be appropriate include alpha-interferon, and genetically engineered epithelial cells. The foregoing substances are listed by way of example and are not meant to be limiting. Other active agents which are currently available or that may be developed in the future are equally applicable. Such 20 other active agents include, for example, any anti-cancers, anti-angiogenesis, antibiotics, anti-fungal agents and antibodies, proteins, peptides, anti-inflammatory agents, steroidal anti-inflammatory agents, antivirals, anticancer drugs, free radical scavengers, Everolimus, sirolimus, sirolimus derivatives, paclitaxel, estradiol, nitric oxide donors, super oxide dismutases, super oxide dismutases mimics, 4-amino-2,2,6,6-tetramethylpiperidine-1-oxyl (4-amino-TEMPO), tacrolimus, 25 dexamethasone, rapamycin, 40-O-(3-hydroxy)propyl-rapamycin, 40-O-[2-(2-hydroxy)ethoxy]ethyl-rapamycin, and 40-O-tetrazole-rapamycin, ABT-578, clobetasol, cytostatic agents, and a combination thereof.

The dosage or concentration of the active agent required to produce a favorable therapeutic effect should be less than the level at which the active agent produces toxic effects 30 and greater than the minimum level at which therapeutic results are obtained. The dosage or concentration of the active agent required to inhibit the desired cellular activity of the vascular region can depend upon factors such as the particular circumstances of the patient; the nature of the trauma; the nature of the therapy desired; the time over which the administered ingredient resides at the vascular site; and if other active agents are employed, the nature and type of those

agents or combinations of those agents. Therapeutic effective dosages can be determined empirically *in vivo*, for example by infusing vessels from suitable animal model systems and using immunohistochemical, fluorescent or electron microscopy methods to detect the agent and its effects, or by conducting suitable *in vitro* studies. Standard pharmacological test procedures to  
5 determine dosages are understood by one of ordinary skill in the art.

Examples of radiopaque elements include, but are not limited to, gold, tantalum, and platinum. An example of a radioactive isotope is  $^{32}\text{P}$ . Sufficient amounts of such substances may be dispersed in the composition such that the substances are not present in the composition as agglomerates or flocs.

#### 10 Method of Coating A Device

The composition described herein can be coated on an implantable device such as a stent by spray coating or any other coating process available in the art. Generally, the coating involves dissolving or suspending the composition, or one or more components thereof, in a solvent or solvent mixture to form a solution, suspension, or dispersion of the composition or one or more  
15 components thereof, applying the solution or suspension to an implantable device, and removing the solvent or solvent mixture to form a coating or a layer of coating. Suspensions or dispersions of the composition described herein can be in the form of latex or emulsion of microparticles having a size between 1 nanometer and 100 microns, preferably between 1 nanometer and 10 microns. Heat and/or pressure treatment can be applied to any of the steps involved herein. In  
20 addition, if desirable, the coating described here can be subjected to further heat and/or pressure treatment. Some additional exemplary processes of coating an implantable device that may be used to form a coating on an implantable using the composition described herein are described in, for example, Lambert TL, et al. Circulation, 1994; 90: 1003-1011; Hwang CW, et al. Circulation, 2001; 104: 600-605; Van der Giessen WJ, et al. Circulation, 1996; 94: 1690-1697; Lincoff AM, et  
25 al. J Am Coll Cardiol 1997; 29: 808-816; Grube E. et al, J American College Cardiology Meeting, March 6 2002, ACCIS2002, poster 1174-15; Grube E, et al, Circulation, 2003, 107: 1, 38-42; Bullesfeld L, et al. Z Kardiol, 2003, 92: 10, 825-832; and Tanabe K, et al. Circulation 2003, 107: 4, 559-64.

The composition can be coated onto the implantable device in the form of a single layer of  
30 coating or components of the composition can be coated onto the device in the form of separate layers of coating.

As used herein, the term "solvent" refers to a liquid substance or composition that is compatible with the polymer and is capable of dissolving or suspending the polymeric composition or one or more components thereof at a desired concentration. Representative

examples of solvents include chloroform, acetone, water (buffered saline), dimethylsulfoxide (DMSO), propylene glycol monomethyl ether (PM), iso-propylalcohol (IPA), n-propyl alcohol, methanol, ethanol, tetrahydrofuran (THF), dimethylformamide (DMF), dimethyl acetamide (DMAC), benzene, toluene, xylene, hexane, cyclohexane, heptane, octane, nonane, decane, 5 decalin, ethyl acetate, butyl acetate, isobutyl acetate, isopropyl acetate, butanol, diacetone alcohol, benzyl alcohol, 2-butanone, cyclohexanone, dioxane, methylene chloride, carbon tetrachloride, tetrachloroethylene, tetrachloro ethane, chlorobenzene, 1,1,1-trichloroethane, 1,1,2-trichloroethane, formamide, hexafluoroisopropanol, 1,1,1-trifluoroethanol, and hexamethyl phosphoramidate and a combination thereof.

10 Examples of such implantable devices include self-expandable stents, balloon-expandable stents, stent-grafts, grafts (e.g., aortic grafts), artificial heart valves, cerebrospinal fluid shunts, pacemaker electrodes, and endocardial leads (e.g., FINELINE and ENDOTAK, available from Guidant Corporation, Santa Clara, CA). The underlying structure of the device can be of virtually any design. The device can be made of a metallic material or an alloy such as, but not limited to, 15 cobalt chromium alloy (ELGILOY), stainless steel (316L), high nitrogen stainless steel, e.g., BIODUR 108, cobalt chrome alloy L-605, "MP35N," "MP20N," ELASTINITE (Nitinol), tantalum, nickel-titanium alloy, platinum-iridium alloy, gold, magnesium, or combinations thereof. "MP35N" and "MP20N" are trade names for alloys of cobalt, nickel, chromium and molybdenum available from Standard Press Steel Co., Jenkintown, PA. "MP35N" consists of 20 35% cobalt, 35% nickel, 20% chromium, and 10% molybdenum. "MP20N" consists of 50% cobalt, 20% nickel, 20% chromium, and 10% molybdenum. Devices made from bioabsorbable or biostable polymers could also be used with the embodiments of the present invention. In one embodiment, the implantable device is a stent.

The compositions described herein can be coated onto a bare metallic or polymeric 25 implantable device or on top of a drug eluting coating on the implantable device.

#### Method of Use

In accordance with embodiments of the invention, a composition in the various 30 embodiments as described above can be applied to an implantable device or prosthesis, e.g., a stent. For compositions including one or more active agents, the agent will remain on the medical device such as a stent during delivery and expansion of the device, and released at a desired rate and for a predetermined duration of time at the implantation site. Preferably, the medical device is a stent. A stent having the above-described coating is useful for a variety of medical procedures, including, by way of example, treatment of obstructions caused by tumors in bile ducts, esophagus, trachea/bronchi and other biological passageways. A stent having the above-

5 The implantable device comprising a coating described herein can be used to treat an animal having a condition or disorder that requires a treatment. Such an animal can be treated by, for example, implanting a device described herein in the animal. Preferably, the animal is a human being. Exemplary disorders or conditions that can be treated by the method disclosed herein include, but not limited to, occlusive atherosclerotic lesions in the coronary vasculature, neointimal hyperplasia in the coronary arteries, restenosis in the coronary arteries, vulnerable plaques of the coronary arteries, atherosclerosis in the renal arteries, atherosclerosis in the carotid arteries, atherosclerosis in the neurovasculature, atherosclerosis in the iliac arteries, atherosclerosis in the femoral arteries, atherosclerosis in the popliteal arteries, atherothrombosis, and occlusive tumors of the prostate, liver, or gastrointestinal tract.

## 15

A drug reservoir layer is applied onto the primer layer, using the same spraying technique, equipment, and formulation used for the applying the primer. A second composition is prepared by mixing the following components:

- (a) 2.0 mass% of the polymer of formula III,
- 5 (b) 0.67mass% of paclitaxel, and
- (c) the balance, a 50/50 blend of chloroform and 1,1,2-trichloroethane.

In this case approximately 220 µg of wet coating is applied, followed by drying, e.g., baking at 50C for about one hour, yielding about 200 µg of drug-polymer reservoir layer. A polymer of the current invention is used as a topcoat layer. Starting with the same polymer of  
10 Formula III used in the drug reservoir, grafting of PEG is carried out using an amino-terminated mPEG of molecular weight of 3400 Daltons. Enough PEG derivative is conjugated so that the final composition is 20% by weight PEG. Using this composition, namely:

- (a) 2.0 mass% of (IV) as described above, and
  - (b) the balance, a 50/50 blend of chloroform and 1,1,2-trichloroethane.
- 15 This composition can be applied onto the drug reservoir layer to form a topcoat layer. Using the same spraying technique and equipment used for applying the drug reservoir layer. Approximately 120 µg of wet topcoat is applied followed by baking at 50C for one hour, yielding a 100 µg topcoat layer of Formula IV to act as a biobeneficial topcoat.

**Example 2. The polymer of Formula IV is used as a matrix in a drug eluting stent**  
20 **coating for the controlled release of paclitaxel from a stent.**

A first composition is prepared by mixing the following components:

- (a) 2.0 mass% of poly(n-butyl methacrylate) (PBMA), and
- (b) the balance, a 50/50 blend by weight of acetone and cyclohexanone.

The first composition is applied onto the surface of bare 12 mm small VISION™ stent  
25 (available from Guidant Corporation). Coating is sprayed and dried to form a primer layer. A spray coater is used having a 0.014 round nozzle maintained at about body temperature with a

feed pressure 2.5 psi (0.17 atm) and an atomization pressure of about 15 psi (1.02 atm). Coating is applied at 20 µg per pass, in between which the stent is dried for 10 seconds in a flowing air stream at 50C. Approximately 110 µg of wet coating was applied. The stents are baked at 50C for one hour, yielding a primer layer composed of approximately 100 µg of PBMA.

5        A drug reservoir layer is applied onto the primer layer, using the same spraying technique, equipment, and formulation used for the applying the primer. Starting with the same polymer of Formula III, grafting of PEG is carried out using an amino-terminated mPEG of molecular weight of 550 Daltons. Enough PEG derivative is conjugated so that the final composition is 5% by weight PEG. Using this composition, namely:

- 10        (a) 2.0 mass% of (IV) as described above,
- (b) 0.5 mass% of paclitaxel, and
- (c) the balance, a 50/50 blend of chloroform and 1,1,2-trichloroethane.

          This composition can be applied onto the primer layer to form a drug reservoir layer. Using the same spraying technique and equipment used for applying the drug reservoir layer.

- 15        Approximately 280 µg of wet is applied followed by baking at 50 °C for one hour, yielding a 250 µg reservoir layer of the polymer of Formula IV to act as a reservoir polymer with higher drug permeability than the polymer of formula III.

**Example 3. The polymer of Formula IV as a topcoat in a drug eluting stent coating for the controlled release of everolimus from a stent.**

- 20        A first composition is prepared by mixing the following components:
- (a) 2.0 mass% of poly(ethylene-co-vinyl alcohol) (EVAL E-151A), and
- (b) the balance, a 70/30 blend by weight of dimethylacetamide and tetrahydrofuran.

- The first composition is applied onto the surface of bare 12 mm small VISION™ stent (available from Guidant Corporation). Coating is sprayed and dried to form a primer layer. A
- 25        spray coater is used having a 0.014 round nozzle maintained at about body temperature with a feed pressure 2.5 psi (0.17 atm) and an atomization pressure of about 15 psi (1.02 atm). Coating is applied at 10 µg per pass, in between which the stent is dried for 10 seconds in a flowing air

stream at 50C. Approximately 120 µg of wet coating was applied. The stents are baked at 140C for one hour, yielding a primer layer composed of approximately 100 µg of EVAL. A drug reservoir layer is applied onto the primer layer, using the same spraying technique, equipment, and polymer as used in applying the primer:

- 5           (a) 2.0 mass% of EVAL E-151A as described above,
- (b) 0.67 mass% of everolimus, and
- (c) the balance, a 70/30 blend by weight of dimethylacetamide and tetrahydrofuran.

This composition can be applied onto the primer layer to form a drug reservoir layer. Using the same spraying technique and equipment used for applying the drug reservoir layer.

- 10   Approximately 240 µg of wet is applied followed by baking at 80C for 30 minutes, yielding a 223 µg reservoir layer. A polymer of the current invention is used as a topcoat layer. Starting with the same polymer of Formula III used in the drug reservoir, grafting of PEG is carried out using an amino-terminated mPEG of molecular weight of 500 Daltons. Enough PEG derivative is conjugated so that the final composition is 20% by weight PEG. Using this composition, namely:

- 15           (a) 2.0 mass% of (IV) as described above, and
- (b) the balance, a 50/50 blend of chloroform and 1,1,2-trichloroethane

This composition can be applied onto the drug reservoir layer to form a topcoat layer. Using the same spraying technique and equipment used for applying the drug reservoir layer. Approximately 120 µg of wet topcoat is applied followed by baking at 50C for one hour, yielding

20   a 100 µg topcoat layer of Formula IV to act as a biobeneficial topcoat.

- While particular embodiments of the present invention have been shown and described, it will be obvious to those skilled in the art that changes and modifications can be made without departing from this invention in its broader aspects. Therefore, the appended claims are to encompass within their scope all such changes and modifications as fall within the true spirit and
- 25   scope of this invention.

## CLAIMS

What is claimed is:

1. A composition for coating an implantable device comprising
  - (1) a first block copolymer comprising a block having a glass transition temperature ( $T_g$ ) below about body temperature and a second block having a  $T_g$  or a melting temperature ( $T_m$ ) above about body temperature, and
  - (2) a material selected from the group consisting of a biobeneficial polymer capable of forming a conjugate with the first block copolymer, a second block copolymer and combination thereof, wherein the second block copolymer comprising
    - (i) a biobeneficial component; and
    - (ii) a component selected from the group consisting of components miscible with the first block copolymer and components insoluble in water,
2. The composition of claim 1 wherein the block having a  $T_g$  above about body temperature has a structure of Formula I and the block having a  $T_g$  below about body temperature has a structure of Formula II:

Formula I

Formula II

wherein  $R_1$ ,  $R_2$ ,  $R_3$  and  $R_4$  are independently hydrogen, phenyl, methyl, ethyl, acrylate, or methacrylate, with the proviso that  $R_1$ ,  $R_2$ ,  $R_3$  and  $R_4$  can not all be hydrogen;

- wherein  $R_5$  and  $R_7$  are independently methyl, ethyl, propyl, butyl, benzyl, or phenyl; and wherein  $R_6$  and  $R_8$  are independently hydrogen, methyl, ethyl, propyl, benzyl, or phenyl.

3. The composition of claim 1 wherein the first block copolymer has the following structure:

Formula III

4. The composition of claim 1 wherein the biobeneficial polymer is covalently attached to the first block copolymer via a chemical linkage.
5. The composition of claim 3 wherein the biobeneficial polymer is covalently attached to the phenyl ring of the structure of Formula III.
- 5 6. The composition of claim 5 wherein the biobeneficial polymer is selected from the group consisting of poly(ethylene glycol), poly(propylene glycol), PLURONIC™ surfactants, poly(tetramethylene glycol), hydroxy functional poly(vinyl pyrrolidone), dextran, dextrin, sodium hyaluronate, hyaluronic acid, heparin, Elastin, Chitosan, poly(2-hydroxyethyl methacrylate), sulphonated poly(styrene), poly(3-hydroxypropyl methacrylamide), 4-amino-2,2',6,6'-
- 10 tetrapiperidine oxide, stable nitroxides, super oxide dimutase mimics, free radical scavengers and combinations thereof.
7. The composition of claim 6 wherein the conjugate has the structure of Formula IV:

Formula IV

8. The composition of claim 6 wherein the conjugate has the structure of Formula V:

Formula V

9. The composition of claim 1 wherein the component of the second block copolymer  
5 miscible with the first block copolymer is a hydrophobic material.

10. The composition of claim 1 wherein the second block copolymer is selected from the group consisting of polystyrene-polyisobutylene-polystyrene block copolymer (SIS), polystyrene, polyisobutylene, polycaprolactone (PCL), poly(L-lactide), poly(D,L-lactide), poly(lactides), poly(lactide-co-glycolide), poly(glycolide), polylactic acid (PLA), polyalkylene,  
10 polyfluoroalkylene, polyhydroxyalkanoate, poly(3-hydroxybutyrate), poly(4-hydroxybutyrate), poly(3-hydroxyvalerate), poly(3-hydroxybutyrate-co-3-hydroxyvalerate), poly(3-hydroxyhexanoate), poly(4-hydroxyhexanoate), mid chain polyhydroxyalkanoate, poly(trimethylene carbonate), poly(ortho ester), polyphosphazenes, poly(phosphoester), poly(tyrosine derived arylates), poly(tyrosine derived carbonates), and a combination thereof.

- 15 11. The composition of claim 1 wherein the water insoluble component is selected from the group consisting of polydimethyloxanone (PDMS), polyvinylidene fluoride (PVDF), polyhexafluoropropylene (HFP), polydimethylsiloxane, poly(vinylidene fluoride-co-hexafluoropropylene) (PVDF-HFP), poly(vinylidene fluoride-co-chlorotrifluoroethylene) (PVDF-CTFE), poly(butyl methacrylate), poly(methyl methacrylate), poly(methacrylates), poly(vinyl  
20 acetate), poly(ethylene-co-vinyl acetate), poly(ethylene-co-vinyl alcohol), poly(ester urethanes), poly(ether-urethanes), poly(carbonate-urethanes), poly(silicone-urethanes), and poly(urea-urethanes), and a combination thereof.

12. The composition of claim 1 wherein the biobeneficial component of the second block copolymer is selected from the group consisting of poly(ethylene glycol), poly(propylene glycol), PLURONIC™ surfactants, poly(tetramethylene glycol), hydroxy functional poly(vinyl pyrrolidone), dextran, dextrin, sodium hyaluronate, hyaluronic acid, heparin, Elastin, Chitosan, poly(2-hydroxyethyl methacrylate), sulphonated poly(styrene), poly(3-hydroxypropyl methacrylamide), 4-amino-2,2',6,6'-tetrapiperidine oxide, stable nitroxides, super oxide dimutase mimics, free radical scavengers and combinations thereof.

13. The composition of claim 1 wherein the second block copolymer is selected from the group consisting of SIS-PEG, polystyrene-PEG, polyisobutylene-PEG, PCL-PEG, PLA-PEG, PDMS-PEG, PVDF-PEG, SIS-hyaluronic acid (HA), polystyrene-HA, polyisobutylene-HA, PCL-HA, PLA-HA, PMMA-HA, PVDF-HA, SIS-heparin, polystyrene-heparin, polyisobutylene-heparin, PCL-heparin, PLA-heparin, PMMA-heparin, and PVDF-heparin.

14. The composition of any of claims 1-13 further comprising a bioactive agent.

15. The composition of claim 14 wherein the bioactive agent is selected from the group consisting of proteins, peptides, anti-inflammatory agents, antivirals, anticancer drugs, anticoagulant agents, free radical scavengers, Everolimus, sirolimus, sirolimus derivatives, paclitaxel, estradiol, steroidal anti-inflammatory agents, antibiotics, nitric oxide donors, super oxide dismutases, super oxide dismutases mimics, 4-amino-2,2,6,6-tetramethylpiperidine-1-oxyl (4-amino-TEMPO), tacrolimus, dexamethasone, rapamycin, 40-O-(3-hydroxy)propyl-rapamycin, 40-O-[2-(2-hydroxy)ethoxy]ethyl-rapamycin, and 40-O-tetrazole-rapamycin, ABT-578, clobetasol, cytostatic agents, and a combination thereof.

16. The composition of claim 15 wherein the free radical scavenger is super oxide dismutase.

17. The composition of claim 15 wherein the bioactive agent is a therapeutic drug for the treatment of restenosis.

18. An implantable device comprising a coating which comprises a composition as defined in accordance with any of claims 1-13.

19. The implantable device of claim 18 further comprises a bioactive agent.

20. The implantable device of claim 18 wherein the bioactive agent is selected from the group consisting of proteins, peptides, anti-inflammatory agents, antivirals, anticancer drugs, anticoagulant agents, free radical scavengers, Everolimus, sirolimus, sirolimus derivatives, paclitaxel, estradiol, steroidal anti-inflammatory agents, antibiotics, nitric oxide donors, super oxide dismutases, super oxide dismutases mimics, 4-amino-2,2,6,6-tetramethylpiperidine-1-oxyl (4-amino-TEMPO), tacrolimus, dexamethasone, rapamycin, 40-O-(3-hydroxy)propyl-rapamycin,

40-*O*-[2-(2-hydroxy)ethoxy]ethyl-rapamycin, and 40-*O*-tetrazole-rapamycin, ABT-578, clobetasol, cytostatic agents, and a combination thereof.

21. The implantable device of claim 19 wherein the free radical scavenger is super oxide dismutase.

5 22. The implantable device of claim 19 wherein the bioactive agent is a therapeutic drug.

23. The implantable device of claim 18 which is a stent.

24. The implantable device of claim 19 which is a DES.

25. The implantable device of claim 20 which is a DES.

10 26. The implantable device of claim 21 which is a DES.

27. The implantable device of claim 22 which is a DES.

28. A method of coating an implantable device comprising coating a composition as defined in claim 1.

15 29. The method of claim 28 wherein the composition further comprising a bioactive agent.

30. A method of treating a disorder in an animal by implanting in the animal the implantable device of claim 18.

31. The method of claim 30 wherein the implantable device is a stent.

20 32. The method of claim 30 wherein the composition further comprises a bioactive agent.

33. The method of claim 32 wherein the bioactive agent is selected from the group consisting of proteins, peptides, anti-inflammatory agents, antivirals, anticancer drugs, anticoagulant agents, free radical scavengers, Everolimus, sirolimus, sirolimus derivatives, paclitaxel, estradiol, steroidal anti-inflammatory agents, antibiotics, nitric oxide donors, super  
25 oxide dismutases, super oxide dismutases mimics, 4-amino-2,2,6,6-tetramethylpiperidine-1-oxyl (4-amino-TEMPO), tacrolimus, dexamethasone, rapamycin, 40-*O*-(3-hydroxy)propyl-rapamycin, 40-*O*-[2-(2-hydroxy)ethoxy]ethyl-rapamycin, and 40-*O*-tetrazole-rapamycin, ABT-578, clobetasol, cytostatic agents, and a combination thereof.

30 34. The method of claim 33 wherein the free radical scavenger is super oxide dismutase.

35. The method of claim 32 wherein the bioactive agent is a therapeutic drug.

36. The method of claim 28 wherein the implantable device which is a stent.

37. The method of claim 32 which is a DES.

38. The method of claim 33 which is a DES.

39. The method of claim 34 which is a DES.
40. The method of claim 35 which is a DES.
41. The method of claim 28 wherein the animal is a human, and  
5 wherein disorder is selected from the group consisting of stenosis, occlusions of the  
arterial vasculature, and vulnerable plaque
42. The method of claim 29 wherein the animal is a human, and  
wherein disorder is selected from the group consisting of stenosis, occlusions of the  
arterial vasculature, and vulnerable plaque
43. The method of claim 30 wherein the animal is a human, and  
10 wherein disorder is selected from the group consisting of stenosis, occlusions of the  
arterial vasculature, and vulnerable plaque
44. The method of claim 31 wherein the animal is a human, and  
wherein disorder is selected from the group consisting of stenosis, occlusions of the  
arterial vasculature, and vulnerable plaque.
- 15 45. The method of claim 32 wherein the animal is a human, and  
wherein disorder is selected from the group consisting of stenosis, occlusions of the  
arterial vasculature, and vulnerable plaque.
46. The method of claim 33 wherein the animal is a human, and  
wherein disorder is selected from the group consisting of stenosis, occlusions of the  
20 arterial vasculature, and vulnerable plaque.
47. The method of claim 34 wherein the animal is a human, and  
wherein disorder is selected from the group consisting of stenosis, occlusions of the  
arterial vasculature, and vulnerable plaque.
48. The method of claim 36 wherein the animal is a human, and  
25 wherein disorder is selected from the group consisting of stenosis, occlusions of the  
arterial vasculature, and vulnerable plaque.
49. The method of claim 37 wherein the animal is a human, and  
wherein disorder is selected from the group consisting of stenosis, occlusions of the  
arterial vasculature, and vulnerable plaque.
- 30 50. The method of claim 38 wherein the animal is a human, and  
wherein disorder is selected from the group consisting of stenosis, occlusions of the  
arterial vasculature, and vulnerable plaque.

51. The method of claim 39 wherein the animal is a human, and wherein disorder is selected from the group consisting of stenosis, occlusions of the arterial vasculature, and vulnerable plaque.

5 52. The method of claim 40 wherein the animal is a human, and wherein disorder is selected from the group consisting of stenosis, occlusions of the arterial vasculature, and vulnerable plaque.

53. The method of claim 41 wherein the animal is a human, and wherein disorder is selected from the group consisting of stenosis, occlusions of the arterial vasculature, and vulnerable plaque.
